WEEK - 5

Demonstration of TTL / Life of a Packet

Create a topology as shown below with 2 PC's and 3 Routers and configure them as shown below

→ In the simulation mode, send a simple PDU from PC0 to PC1

→ Use capture button to capture every transfer

→ During every transfer of the PDU, we observe a decrement in the TTL as it moves from one device to another.

TTL at PC0 : 255
TTL at R1 : 254
TTL at R2 : 253
TTL at R3 : 252

Result: The TTL value was successfully observed as packets passed through the routers from PC0 to PC1. The TTL decreased by 1 at each router hop, thus demonstrating how routers prevent packets from circulating indefinitely in the network
